

Every journey deserves its own world.

A living 3D Memory Atlas that turns scattered travel history into something you can search, relive, plan from and share.

Travel now has its own B.C. and A.C.

Before COVID / After COVID

B.C.

BEFORE COVID

Travel squeezed around an office, fixed routines and a few protected breaks.

A.C.

AFTER COVID

The laptop became the office. Time, freedom and meaningful experiences moved closer to the centre of life.

Founder insight

Wall maps. Paper journals. Camera rolls. Hard drives.

Each keeps one fragment. None becomes one living Atlas.

One Atlas reconnects place, story and people.

Five jobs become one loop: import · remember · retrieve · plan · share

01 Spatial memory

A high-quality WebGL globe with a familiar 2D map fallback.

02 Mine or Circle

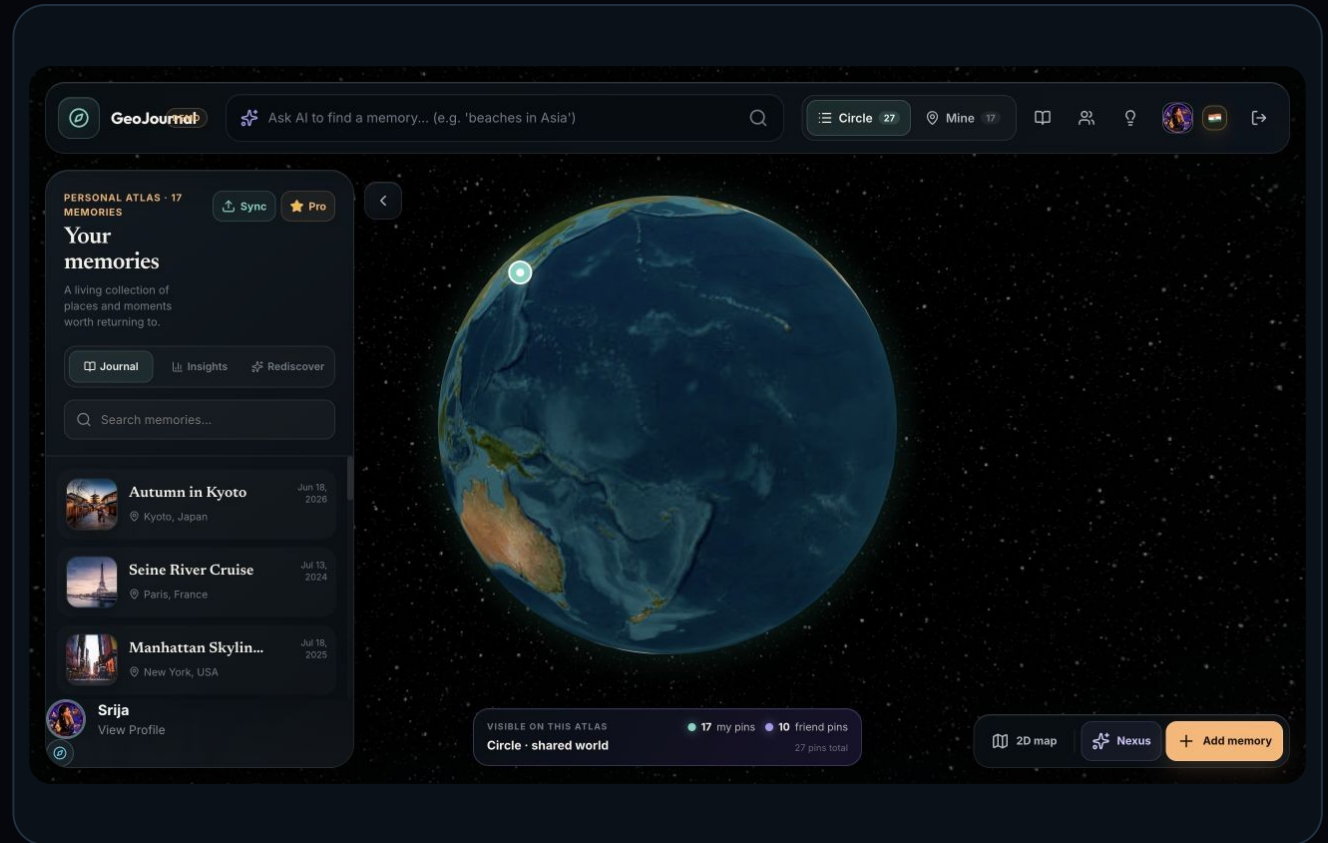

Teal keeps my memories distinct; violet brings trusted explorers into view.

03 Context on every pin

Place, date, photos, journal text and author stay connected.

17 personal memories

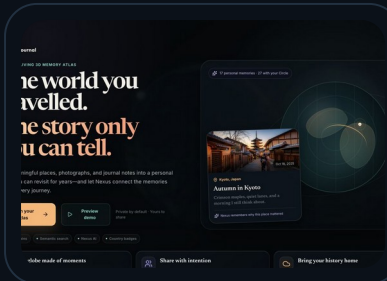

27 Circle pins

Trust starts before the first pin.

A guided path makes an unfamiliar 3D product feel immediate—and keeps every import consent-first.

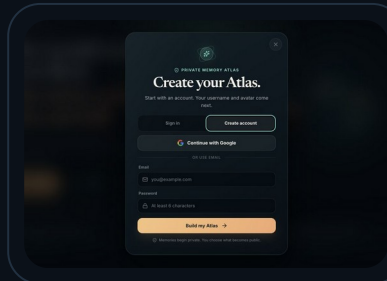

01

Arrive

Understand the promise

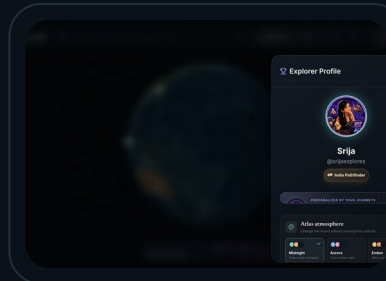

02

Create

Open a private Atlas

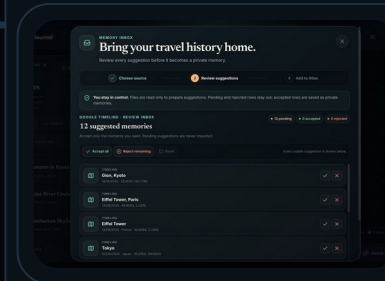

03

Personalize

Username, avatar,
theme

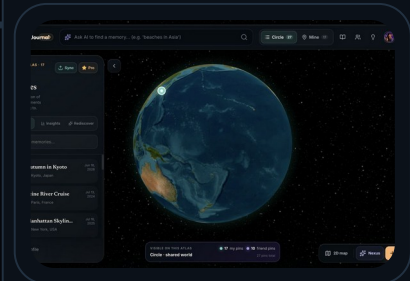

04

Review

Accept or reject imports

05

Explore

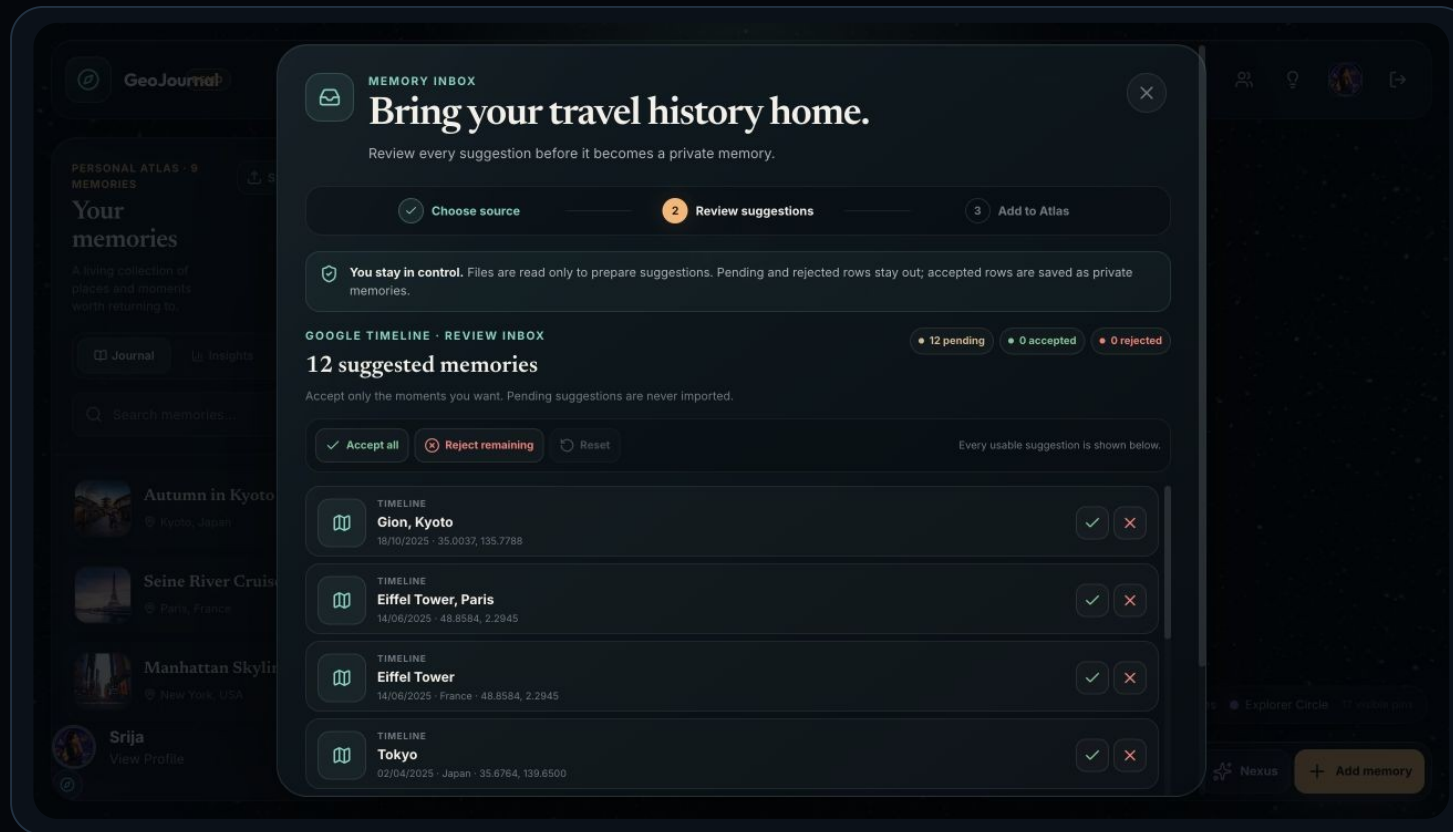

17 memories become a
world

Demo-only guided tour

Six spotlight steps • Next / Back / Skip • desktop + mobile • launch with ?demo=1&tour=1

Start with history, not an empty globe.

Google Timeline and geotagged Instagram exports become suggestions first. Nothing is silently published.

01 Choose an export

Current or legacy Timeline JSON; Instagram archive rows only when coordinates exist.

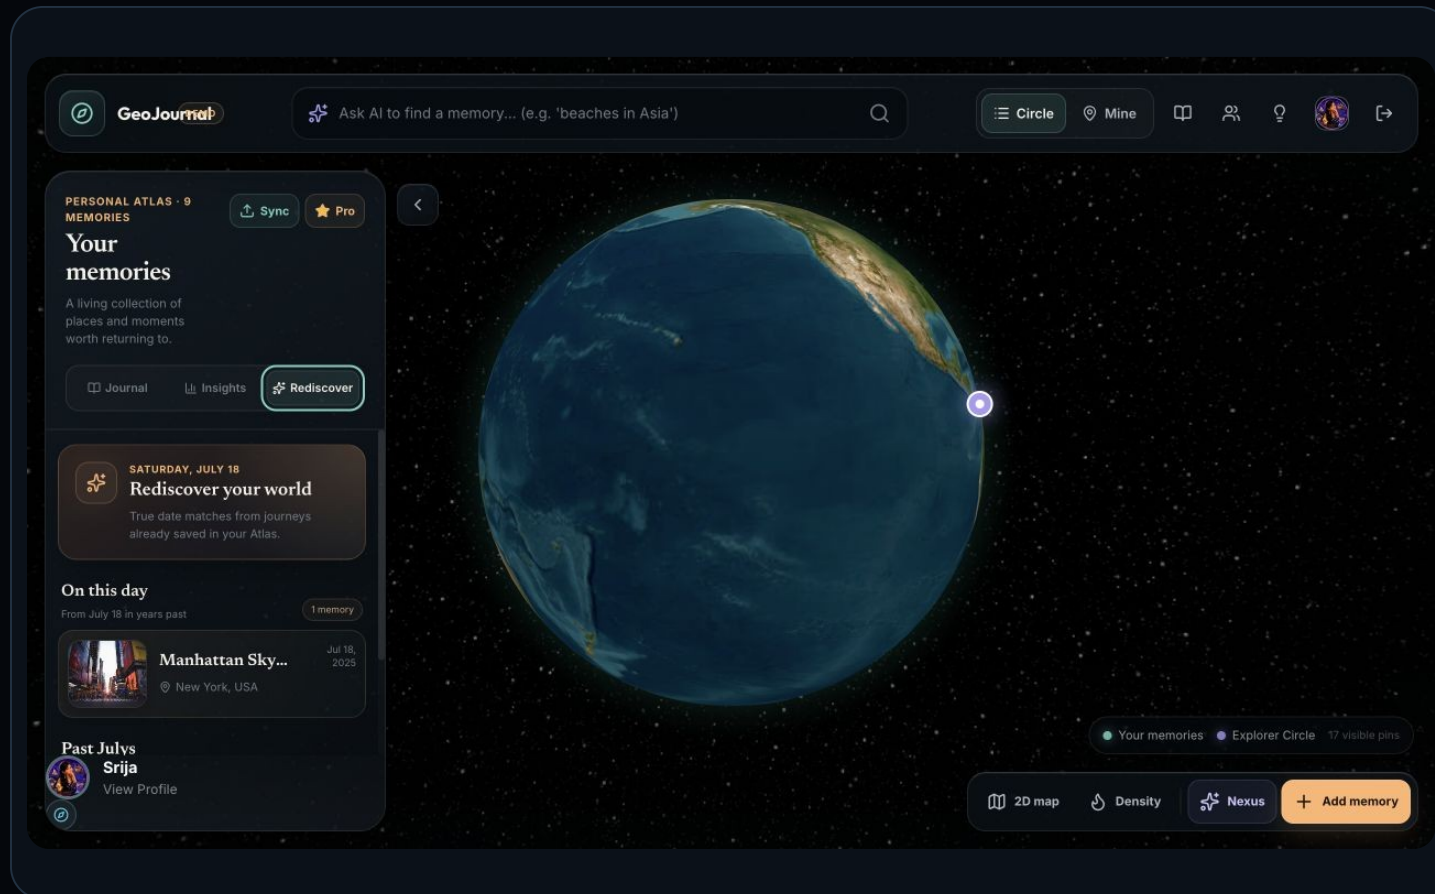

02 Accept or reject

Every suggested place stays in a human review inbox.

03 Private by default

Only accepted memories become pins, and users decide if they are ever shared.

The Atlas gives old memories a second life.

Search by meaning

“Crimson streets” can focus Kyoto—even when the place name is never typed.

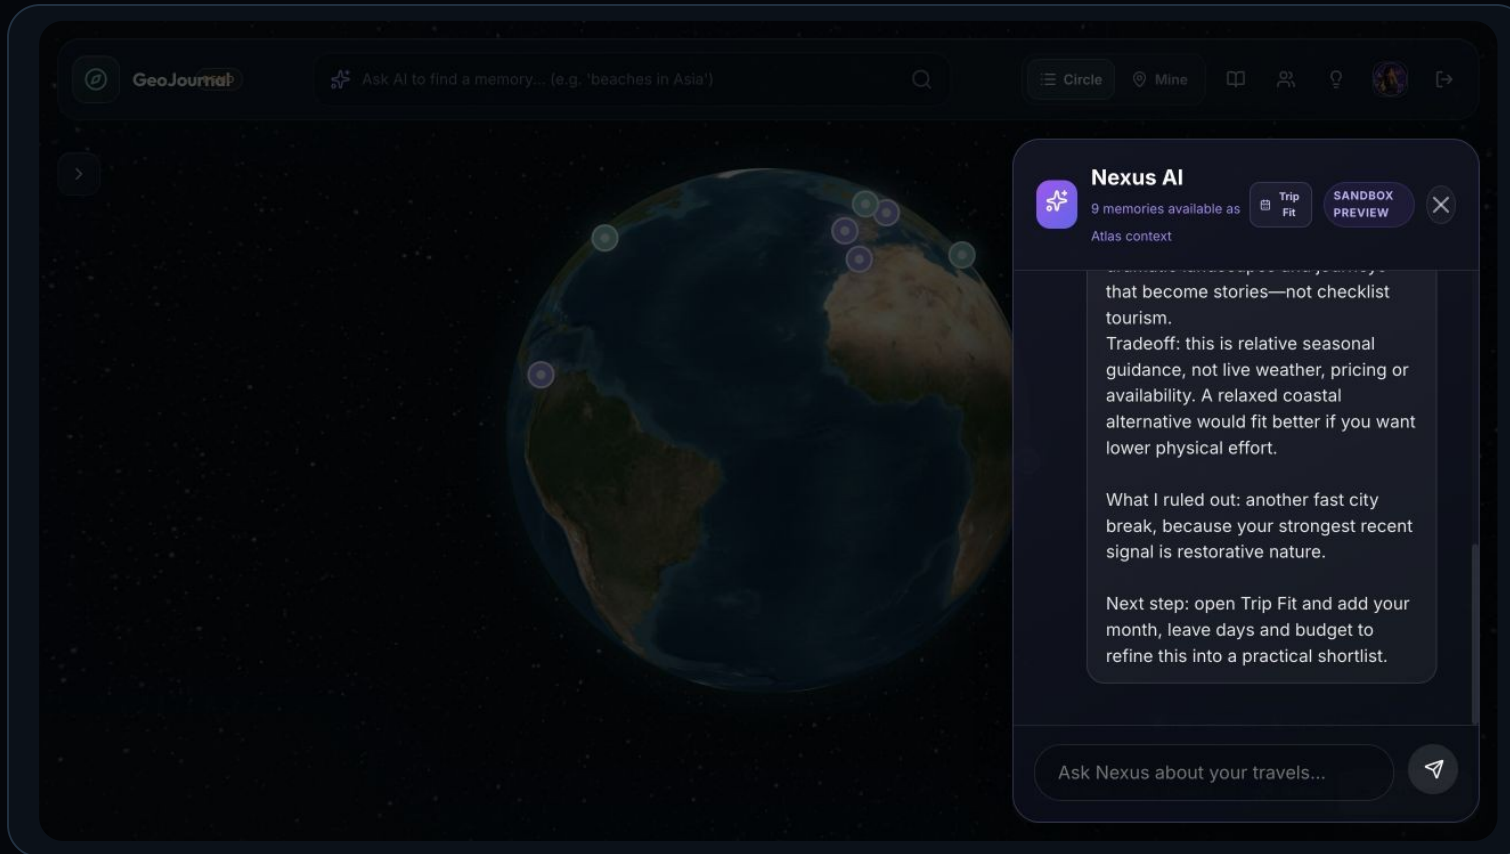

Rediscover on purpose

On this day and past-month moments make nostalgia a product habit instead of an accident.

Semantic search keeps a local fallback for a stage-safe demo.

Plan forward from the life already lived.

Nexus grounds the next trip in Atlas memories, then adds practical Trip Fit constraints.

01 Atlas context

Past places, stories and recurring preferences shape the answer.

02 Trip Fit

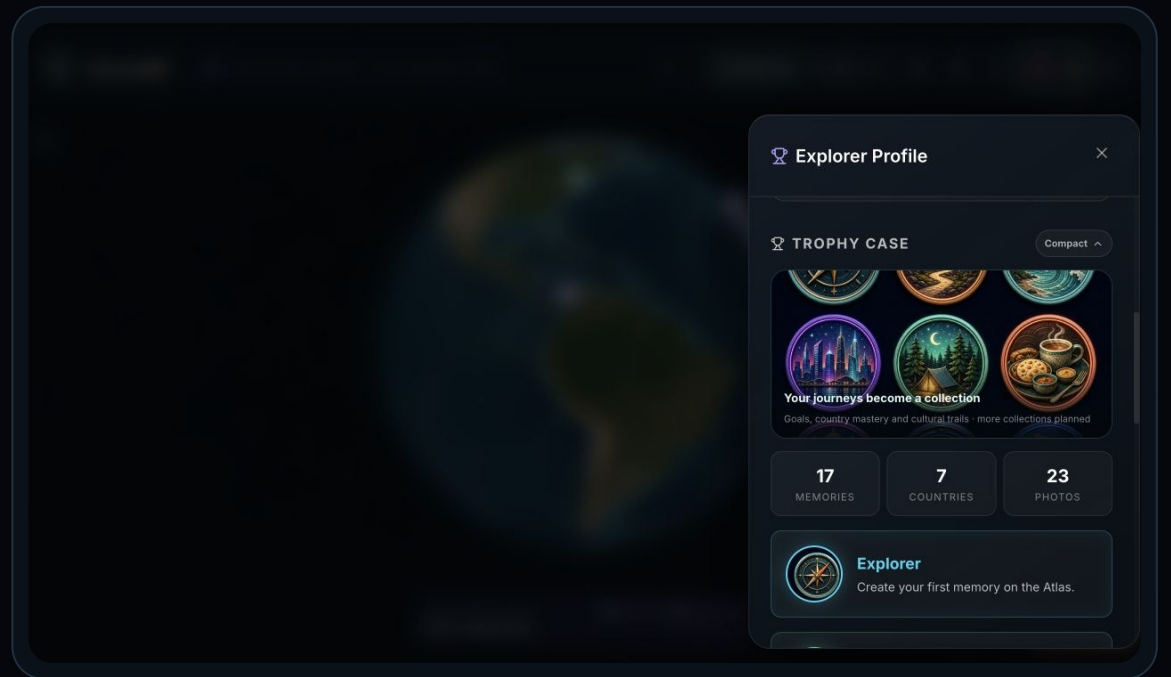

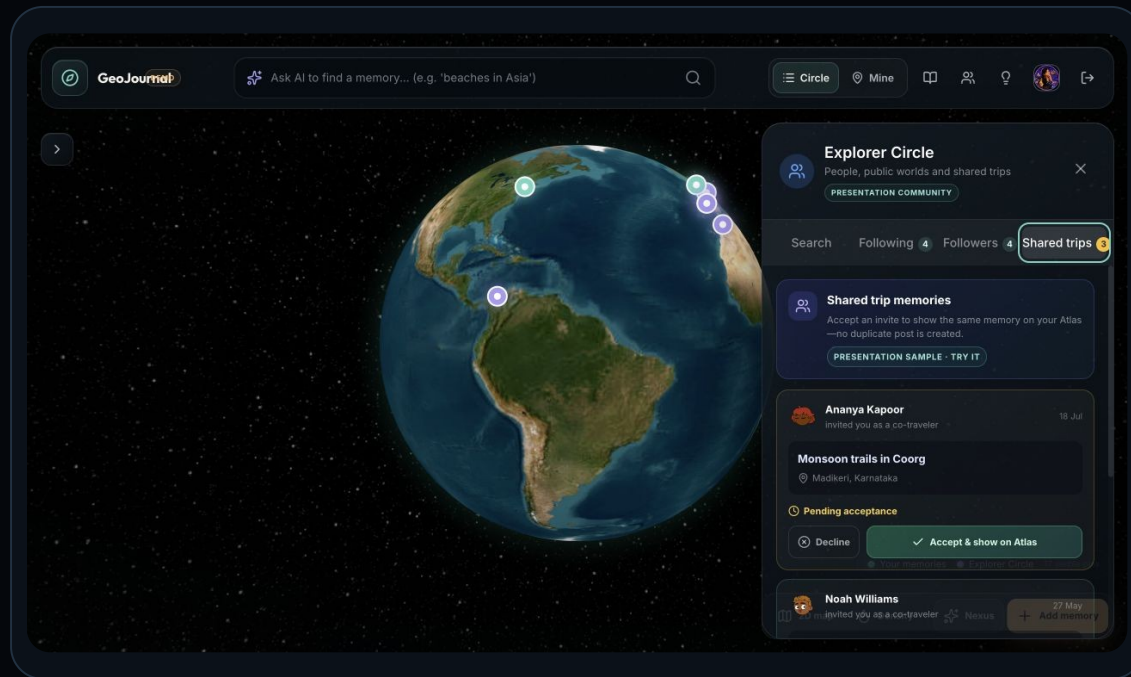

Month, leave days, home city, budget, holidays and local ICS events.

03 Honest infrastructure

OpenAI is configurable. Maximem Synap is active; the consented server bridge is next.

Community has consent. Progress has personality.

Authorship stays explicit while badges turn a private archive into a journey worth continuing.

01 Accept before sharing

Co-traveler memories appear only after consent.

02 Explore friend globes

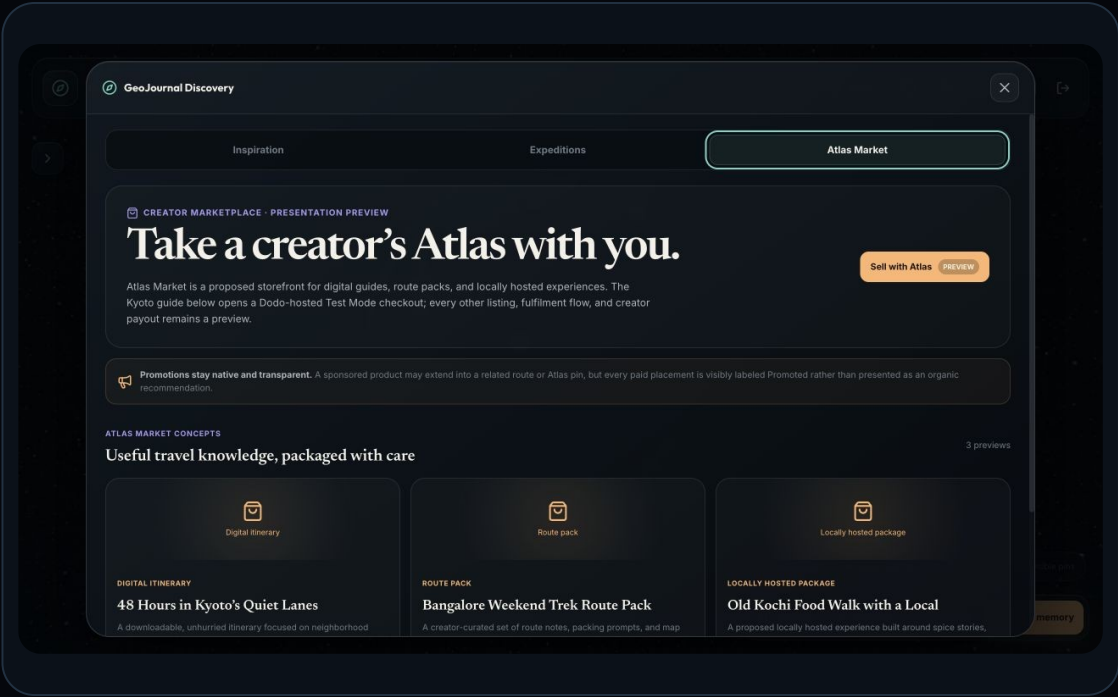

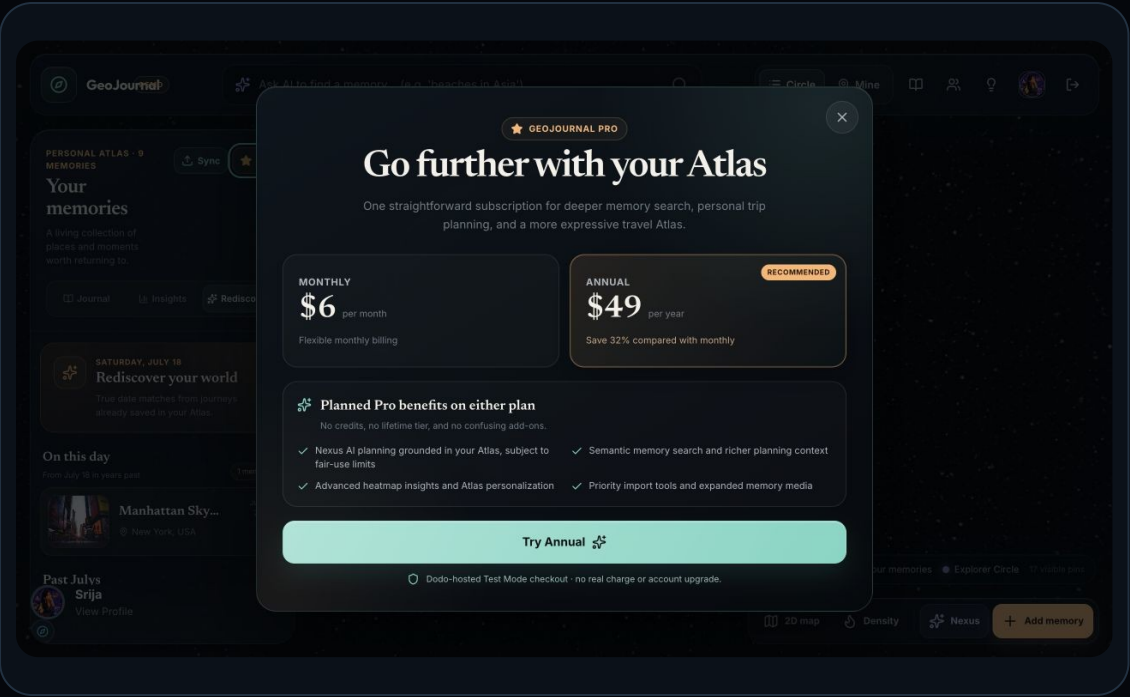

Circle keeps friend pins violet and clearly authored.

03 Earn the journey

Country Pathfinder unlocks after four distinct cities.

A simple subscription, then a creator economy.

Users pay for a trusted travel companion—not metered AI tokens.

\$6 monthly **\$49** annual · 32% lower

Creator guides · trip groups · labelled promotions

Dodo-hosted Test Mode checkout validated · no production charge or fulfilment claimed

Start with people who already curate their journeys.

Frequent independent travelers and creators are the first customer: they already keep photos, notes or map history—but cannot use them together.

01 Global product, focused beachhead

Launch globally; build the first dense community through US travel clubs and creator networks.

02 A built-in acquisition loop

A shareable Atlas brings the next traveler in through a memory, not an ad.

THE QUESTION

What would make you trust GeoJournal with your full travel history?

Trust that scales with memory.

Move the AI layer server-side while the traveler remains in control of every memory.

- 01 Consented Maximem ingestion and retrieval
- 02 Export, deletion and revocation controls
- 03 Production Dodo webhooks and entitlements

Trip Rooms turn chat into a shared journey.

Two or more travelers plan with Nexus in one permissioned room, then accept the shared memory afterward.

- 01 Date polls, budgets and place suggestions
- 02 A compromise itinerary grounded in the group
- 03 Shared Atlas memory only after acceptance

Nexus finds the window you can actually take.

Availability becomes part of personalization—not a constraint discovered after the recommendation.

- 01 Calendar, public holidays and office holidays
- 02 Leave balance, month and budget fit
- 03 Live fare and stay signals when available

The Atlas follows you into your pocket.

A native mobile experience captures moments faster and brings the right public memories back at the right time.

- 01 PWA first, then Play Store and App Store
- 02 Followed explorer posts → instant notification
- 03 Deep-link straight to the public memory pin

Travel goals become collectible.

Badges grow from lightweight rewards into culturally meaningful, community-shaped travel quests.

- 01 **Seven Wonders • 12 Jyotirlingas • 12 Pushkarams**
- 02 Annual targets and seasonal collections
- 03 Traveler-submitted ideas with community voting

Trusted expertise becomes travel inventory.

Creators and organizers can earn from the journeys they already know how to design.

- 01 Paid digital guides and travel packages
- 02 Verified trip groups and clear fulfilment
- 03 Dodo payouts plus transparent promotions

Every accepted memory improves the graph.

The moat is not a generic model. It is a permissioned understanding of what each traveler values.

- 01 Direct provider sync where permissions allow
- 02 Accepted, rejected and revisited suggestions
- 03 Multimodal memory graph with graceful fallback

Travel history becomes visual identity.

A one-of-one profile portrait and atmosphere make every Atlas feel unmistakably personal.

- 01 **AI-generated avatars grounded in travel motifs**
- 02 **Saved themes, passports and profile collections**
- 03 **A shareable identity that evolves with the journey**
