

Every journey deserves its own world.

A living 3D Memory Atlas that turns scattered travel history into something you can search, relive, plan from and share.

THE PROBLEM

Travel memories survive. Their meaning gets fragmented.

Photos keep the image. Maps keep the location. Journals keep the feeling. Planning tools ask us to start again.

PHOTOS

What it looked like

Thousands of moments, but weak memory of context.

MAPS

Where it happened

Pins and routes, but almost none of the story.

JOURNALS

Why it mattered

Rich reflection, but disconnected from place and discovery.

The memory is not missing. The connection is.

One Atlas reconnects place, story and people.

Five jobs become one loop: import · remember · retrieve · plan · share

01 Spatial memory

A high-quality WebGL globe with a familiar 2D map fallback.

02 Mine or Circle

Teal keeps my memories distinct; violet brings trusted explorers into view.

03 Context on every pin

Place, date, photos, journal text and author stay connected.

9 personal memories

17 Circle pins

Start with history, not an empty globe.

Google Timeline and geotagged Instagram exports become suggestions first. Nothing is silently published.

01 Choose an export

Current or legacy Timeline JSON; Instagram archive rows only when coordinates exist.

02 Accept or reject

Every suggested place stays in a human review inbox.

03 Private by default

Only accepted memories become pins, and users decide if they are ever shared.

The Atlas gives old memories a second life.

Search by meaning

“Crimson streets” can focus Kyoto—even when the place name is never typed.

Rediscover on purpose

On this day and past-month moments make nostalgia a product habit instead of an accident.

Semantic search keeps a local fallback for a stage-safe demo.

Plan forward from the life already lived.

Nexus grounds the next trip in Atlas memories, then adds practical Trip Fit constraints.

01 Atlas context

Past places, stories and recurring preferences shape the answer.

02 Trip Fit

Month, leave days, home city, budget, holidays and local ICS events.

03 Honest infrastructure

OpenAI is configurable. Maximem Synap is active; the consented server bridge is next.

Travel together without giving up privacy.

Community is useful only when visibility and authorship remain explicit.

01 Co-traveler consent

A shared memory appears on a friend's Atlas only after acceptance.

02 Friend globes

Open a public profile and explore that person's world spatially.

03 Layered visibility

Private, close friends and public are choices made per memory.

Seeded presentation community · interaction design is live

A simple subscription, then a creator economy.

Users pay for a trusted travel companion—not metered AI tokens.

\$6 monthly **\$49** annual · 32% lower

Creator guides · trip groups · labelled promotions

Dodo-hosted Test Mode checkout validated · no production charge or fulfillment claimed

Start with people who already curate their journeys.

Frequent independent travelers and creators are the first customer: they already keep photos, notes or map history—but cannot use them together.

01 Global product, focused beachhead

Launch globally; build the first dense community through US travel clubs and creator networks.

02 A built-in acquisition loop

A shareable Atlas brings the next traveler in through a memory, not an ad.

THE QUESTION

What would make you trust GeoJournal with your full travel history?
